FastAPI, Pydantic and Uvicorn

Three Python tools that work together to build fast, typed web APIs

The framework

FastAPI

Turns plain Python functions and type hints into API endpoints, with automatic interactive docs at /docs.

The data layer

Pydantic

Validates and parses incoming and outgoing data using models built from Python type annotations.

The server

Uvicorn

A lightweight ASGI server that runs the app and handles async HTTP connections.

Request flow: Uvicorn receives it, FastAPI routes it, Pydantic validates it.
